(c) The 2010 value for retained earnings would decrease by \$70,000 to \$400,000. In addition, assets would have to decrease by \$70,000 or other liabilities would have to increase by the same amount. Clearly, dividend payouts of this magnitude are very unhealthy for this company's cash flow, particularly since the firm appears to be borrowing funds while expanding their Fixed Asset Base. Companies must have accumulated profits AND liquidity in order to pay dividends.

127. Assume the company has issued 15,000 bonds with a coupon rate of 10% and a face value of \$1,000 per bond, and the company has a marginal tax rate of 40%. Calculate the annual after-tax cost of the interest expense.

Annual interest expense = \$15,000 x 10% = \$ 1,500 After-tax cost = \$1,500 x (1 - tax rate) = \$ 1,500 x (1 - .40) = \$ 900
