183. (a) Assume p, prove q.
   (b) Assume $\neg q$, prove $\neg p$.
   (c) Assume $p \wedge \neg q$, show that this leads to a contradiction.

184. Direct proof: Assume p, show q. Indirect proof: Assume $\neg q$, show $\neg p$.

185. Suppose $x = 2k + 1$, $y = 2l$. Therefore $x + y = 2k + 1 + 2l = 2(k + l) + 1$, which is odd.

186. Suppose $n = 2k+1$ but $n^2 = 2l$. Therefore $(2k+1)^2 = 2l$, or $4k^2 + 4k + 1 = 2l$. Hence $2(2k^2 + 2k - l) = -1$ (even = odd), a contradiction. Therefore n^2 is odd.

187. Let $x = 2k + 1$, $y = 2l + 1$. Therefore $x + y = 2k + 1 + 2l + 1 = 2(k + l + 1)$, which is even.

188. Suppose $x = 2k + 1$ and $y = 2l + 1$, but $x + y = 2m + 1$. Therefore $(2k + 1) + (2l + 1) = 2m + 1$. Hence $2(k + l - m + 1) = 1$ (even = odd), which is a contradiction. Therefore $x + y$ is even.

189. Suppose $x = 2k$ and $y = 2l$, but $xy = 2m + 1$. Therefore $2k \cdot 2l = 2m + 1$. Hence $2(2kl - m) = 1$ (even = odd), which is a contradiction. Therefore xy is even.

190. Let $x = 2k + 1$. Therefore $x + 2 = 2k + 1 + 2 = 2(k + 1) + 1$, which is odd.

191. Suppose $x + 2 = 2k$. Therefore $x = 2k - 2 = 2(k - 1)$, which is even.

192. Suppose x is odd but $x+2$ is even. Therefore $x = 2k+1$ and $x+2 = 2l$. Hence $(2k+1)+2 = 2l$. Therefore $2(k + 1 - l) = -1$ (even = odd), a contradiction.

193. Let $n = 2k$. Therefore $n + 1 = 2k + 1$, which is odd.

194. Suppose $n + 1$ is even. Therefore $n + 1 = 2k$. Therefore $n = 2k - 1 = 2(k - 1) + 1$, which is odd.

195. Suppose $n = 2k$ but $n + 1 = 2l$. Therefore $2k + 1 = 2l$ (even = odd), which is a contradiction.

196. If n is even, then $n = 2k$. Therefore $3n^2 + 8 = 3(2k)^2 + 8 = 12k^2 + 8 = 2(6k^2 + 4)$, which is even. If n is odd, then $n = 2k + 1$. Therefore $3n^2 + 8 = 3(2k + 1)^2 + 8 = 12k^2 + 12k + 11 = 2(6k^2 + 6k + 5) + 1$, which is odd.

197. If n is even, then $n^2 = (2k)^2 = 2(2k^2)$, which is even. If n is odd, then $n^2 = (2k + 1)^2 = 2(2k^2 + 2k) + 1$, which is odd.

198. If $m = 2k$ and $n = 2l$, then $mn = 4kl$. Hence mn is a multiple of 4.

199. False: $x = 2$, $y = 1/2$

200. False: $x = 1/2$

201. False: $x = 3/2$, $y = 3/2$

202. Case 1, $x \geq 0$: then $x = |x|$, so $x \leq |x|$. Case 2, $x < 0$: here $x < 0$ and $0 < |x|$, so $x < |x|$.

203. We prove the statement by cases. The two cases $1 \leq x \leq 5$ or $x \geq 6$ are exhaustive. In the first case, if $1 \leq x \leq 5$, then $x^2 \leq 25$ so $x^2 \neq 27$. In the second case, if $x \geq 6$, then $x^2 \geq 36$ and $x^2 \neq 27$. So $x^2 \neq 27$ for all positive integers x and we conclude that 27 is not a perfect square.

204. It is easier to give a contraposition proof; it is usually easier to proceed from a simple expression (such as n) to a more complex expression (such as $3n + 5$ is even). Begin by supposing that n is not odd. Therefore n is even and hence $n = 2k$ for some integer k. Therefore $3n + 5 = 3(2k) + 5 = 6k + 5 = 2(3k + 2) + 1$, which is not even. If we try a direct proof, we assume that $3n + 5$ is even; that is, $3n + 5 = 2k$ for some integer k. From this we obtain $n = (2k - 5)/3$, and it it not obvious from this form that n is even.

205. Prove that (a) and (b) are equivalent and that (a) and (c) are equivalent.

206. If at most three people were born in each of the 12 months of the year, there would be at most 36 people.

207. Give a proof by cases. There are only six cases that need to be considered: $x = y = 1$; $x = 1$, $y = 2$; $x = 1$, $y = 3$; $x = 2$, $y = 1$; $x = y = 2$; $x = 2$, $y = 3$.

208. The steps in the "proof" cannot be reversed. Knowing that the squares of two numbers, -3 and 3, are equal does not allow us to infer that the two numbers are equal.
