Biometric devices authenticate a person's identity by verifying unique personal characteristics. These devices translate a biometric identifier, such as a fingerprint, into a digital code that is compared with a digital code stored in a computer. If the digital code in the computer matches the personal characteristic code, the computer grants access. Examples of biometric devices include fingerprint readers and face recognition systems.

A fingerprint reader, or scanner, captures curves and indentations of a fingerprint. Organizations use fingerprint readers to secure doors, computers, and software. For example, a fingerprint reader can be set up to authenticate users before they can access a computer (Rossi). External fingerprint readers usually plug into a USB port. To save on desk space, some laptops include built-in fingerprint readers.<sup>5</sup>

A face recognition system captures a live face image and compares it with a stored image to determine if the person is a legitimate user. Some buildings use face recognition systems to secure access to rooms. Law enforcement, surveillance systems, and airports use face recognition systems to protect the public. Some mobile devices use face recognition systems to unlock the

device. Face recognition systems are becoming more sophisticated and can recognize people with or without glasses, hats, facial hair, makeup, or jewelry, and with new hairstyles (Adenstuth).

Home and business users alike are using biometric security. Through a biometric identifier, such as a fingerprint, biometric devices can deny or grant access to programs, devices, computers, rooms, and other locations. Biometric devices are an effective security technology.

ANSWER: You should evaluate sources for authority, currency, and accuracy. Be especially wary of information obtained from the web. Any person, company, or organization can publish a webpage on the Internet. Ask yourself these questions about the source:

- *Authority: Does a reputable institution or group support the source? Is the information presented without bias? Are the author's credentials listed and verifiable?*
- *Currency: Is the information up to date? Are dates of sources listed? What is the last date revised or updated?*
- *Accuracy: Is the information free of errors? Is it verifiable? Are the sources clearly identified?*

98. List the general guidelines to follow as you create a research paper.

ANSWER:

- *Select a topic. Spend time brainstorming ideas for a topic. Choose one you find interesting. For shorter papers, narrow the scope of the topic; for longer papers, broaden the scope. Identify a tentative thesis statement, which is a sentence describing the paper's subject matter.*
- *Research the topic and take notes, being careful not to plagiarize.*
- *Organize your ideas. Classify your notes into related concepts. Make an outline from the categories of notes. In the outline, identify all main ideas and supporting details.*
- *Write the first draft, referencing sources. From the outline, compose the paper. Every research paper should include an introduction containing the thesis statement, supporting details, and a conclusion. Follow the guidelines identified in the required documentation style. Reference all sources of information.*
- *Create the list of sources. Using the formats specified in the required documentation style, completely*

## Chapter 02: Creating a Research Paper with References and Sources

*list all sources referenced in the body of the research paper in alphabetical order.*

• *Proofread and revise the paper. If possible, proofread the paper with a fresh set of eyes, that is, at least one to two days after completing the first draft. Proofreading involves reading the paper with the intent of identifying errors (spelling, grammar, etc.) and looking for ways to improve the paper (wording, transitions, flow, etc.). Try reading the paper out loud, which helps to identify unclear or awkward wording. Ask someone else to proofread the paper and give you suggestions for improvements.*
