67. The meta tag	g is a(n) tag so it doe one-sided	es not require a closing tag in HTML5.		
POINTS:	1			
REFERENCES:	30			
68. Name three of briefly.	of the four goals your websi	te should try to achieve in order to med	et accessibility standards. Describe each	
ANSWER:	The goals are: perceivable	, operable, understandable, and robust		
	Perceivable: All your web page content needs to be accessible in whatever format a given user needs so that the content can be perceived by the user. For example, visual content should be accompanied by text descriptions that can be read aloud for the visually impaired.			
	Operable: All web page content need to function at the user's comfort level, which means things like allowing the user to scroll at his/her pace or making sure that clickable items can be accessed via a mouse and other ways as well (such as touch or keyboard commands).			
	Understandable: The language that a web page is written in should be indicated, and ways to understand any specialized vocabulary in the web page should be included.			
	Robust: Web pages should	be coded according to web standards.		
POINTS:	1

TOPICS:	Critical Thinking			
	difference between debugging and validating your HTML code and why should you do both? Debugging is when you look for and correct code that was incorrectly written, such as forgetting an opening tag or omitting a closing > on a tag. When debugging, a good place to start is by opening your page in a browser. You can often see problems that need to be corrected, such as a wrong size header or a misplaced element, in a browser but not always because some browsers can interpret a web page as expected in spite of code that doesn't conform to specifications. Debugging helps you to correct problems.			
	Once you have debugged your program, you should validate it. Validation is an automated process of comparing code you've written against HTML5 coding standards. Validation will find errors you might be able to find when you debug your code, but it will also find other errors, such as code violations.			
		rrors by debugging your code and to va with future versions of user agents and	alidating your code to help ensure your d HTML code.	

POINTS: 1 *REFERENCES*: 40, 42

TOPICS: Critical Thinking

70. Please describe each of the following viewport attribute values: width, height, initial-scale, minimum-scale, maximum-scale, user-scalable, and device-width. Which is the most commonly used attribute and why?

Name:	Class:	Date:
		· · · · · · · · · · · · · · · · · · ·

Unit B Structuring Content in a Web Document

ANSWER: width: sets the width of the viewport

height: sets the height of the viewport

initial-scale: sets the scale of the viewport when the document opens

minimum-scale: sets the lower limit on the scale of the viewport

maximum-scale: sets the upper limit on the scale of the viewport

user-scalable: sets whether a user is allowed to zoom a page or not

device-width: scales the page to fit the browser window

device-width is the most commonly used attribute because it scales the page to fit the browser window which means it will fit in a browser on a desktop or on a mobile device.
